Product Name :
Clutch

Product Code :
LBNY-0005-12000052

Description :

The friction disks are pushed together, and force transmission comes about as a result of the friction. The slip can be varied with the help of an electronically controlled throttle valve. It replaces the known viscous clutch in four-wheel drive. As soon as a difference in speed comes about between the front and the rear axle, the swash plate turns in the housing. Fluid is pressed to the disk plunger by hydraulic pistons.

- Cut Open Parts:
Differential housing
Clutch housing
Hydraulic piston
Electronic control unit
Stepper motor
Friction disks
Pump plunger

The function of the pump plungers and the differential can be shown by turning on the gearbox flange. Electric motor with inlet pressure pump and all the valves.

Technical Specification :

Clutch
