**Product Name :**  
Vibration Absorber Apparatus

**Product Code :**  
LBNY-0005-18700014

www.laboratoryinstrumentindia.com

**Description :**

A central block is clamped to the test beam. Vibration Absorber carries two spring steel strips which are clamped in a cantilever arrangement transversely across the test beam. Experimental module, which fits into the Vibrations frame making up part of the Universal Vibration Apparatus. With the aid of the LVDT from the cantilevers and mass system can be tuned to the same natural frequency as the surround test beam and motor exciter. Attached onto each cantilever is a set of masses, which can have their magnitude and position adjusted. Once this is achieved the resonance frequency of the original system can be observed along with the resonance frequency of the Vibration Absorber itself.

**Technical Specification :**

Tuning of vibration absorber achievable through testing and moving masses  
To be attachable to test beam  
To be an experimental module making up part of the Universal Vibration Apparatus  
To consists of central attachment block with two spring steel cantilevers onto which masses are clamped  
Excellent visual demonstrator.
